Hi Tina;

Attached is the most recent version of DEQ12 and the first draft of the flow chart per the meeting we had earlier this week.

Mike

# **DEPARTMENT CIRCULAR**

DRAFT

## **DEQ-12, PARTS A and B**

**Montana Base Numeric Nutrient Standards  
and Nutrient Standards Variances**

## GENERAL INTRODUCTION

This circular contains information pertaining to the base numeric nutrients standards (§75-5-103[2], MCA) and their implementation. It is divided into **Parts A** and **B**. **Part A** contains the water quality standards including concentration limits, where they apply, and their period of application. **Part A** is adopted by the Board of Environmental Review under its rulemaking authority in §75-5-301(2), MCA.

**Part B** contains information about variances from the base numeric nutrient standards. This includes effluent treatment requirements associated with general nutrient standards variances, as well as effluent treatment requirements for individual nutrient standards variances and to whom these apply. **Part B** also contains the Department's definition of the total nitrogen (TN) and total phosphorus (TP) concentrations achievable at the limits of technology. Unlike **Part A**, **Part B** is not adopted by the Board of Environmental Review; **Part B** is adopted by the Department following its formal rule making process, pursuant to §75-5-313, MCA.

The Department has reviewed a considerable amount of scientific literature and has carried out scientific research on its own in order to derive the base numeric nutrient standards (see **References** in **Part A**). Because many of the base numeric nutrient standards are stringent and may be difficult for MPDES permit holders to meet in the short term, Montana's legislature adopted laws (e.g., §75-5-313, MCA) allowing for the achievement of the standards over time. This approach should allow time for nitrogen and phosphorus removal technologies to improve and become less costly, and to allow time for nonpoint sources of nitrogen and phosphorus pollution to be better addressed.

# Circular DEQ-12, PART A

SEPTEMBER 2012 EDITION

## 1.0 Introduction

Elements comprising Circular DEQ-12, **Part A** are found below. These elements are adopted by the Montana Board of Environmental Review. The nitrogen and phosphorus concentrations provided here have been set at levels that should protect beneficial uses, and prevent instream exceedences of other surface water quality standards which are commonly related to nutrients (e.g., dissolved oxygen standards; see Circular DEQ-7). The nitrogen and phosphorus concentrations also reflect the intent of the narrative standard at ARM 17.30.637(1)(e), and will preclude the need for case-by-case interpretations of the narrative standard.

## 1.1 Definitions

1. **Ecoregion** means mapped regions of relative homogeneity in ecological systems, derived from perceived patterns of a combination of causal and integrative factors including land use, land surface form, potential natural vegetation, soils, and geology. See also, endnote 1.
2. **Large river** means a perennial waterbody which has, during summer and fall baseflow (August 1 to October 31 each year), a wadeability index (product of river depth [in feet] and mean velocity [in ft/sec]) of 7.24 ft<sup>2</sup>/sec or greater, a depth of 3.15 ft or greater, or a baseflow annual discharge of 1,500 ft<sup>3</sup>/sec or greater. See also, endnote 4.
3. **Total nitrogen** means the sum of all nitrate, nitrite, ammonia, and organic nitrogen, as N, in an unfiltered water sample. Total nitrogen in a sample may also be determined via persulfate digestion, or as the sum of total kjeldahl nitrogen plus nitrate plus nitrite.
4. **Total phosphorus** means the sum of orthophosphates, polyphosphates, and organically bound phosphates, as P, in an unfiltered water sample. Total phosphorus may also be determined directly by persulfate digestion.
5. **Wadeable stream** means a perennial or intermittent stream in which most of the wetted channel is safely wadeable by a person during baseflow conditions.

## 2.0 Base Numeric Nutrient Standards

**Table 12A-1** below shows the base numeric nutrient standards for Montana's wadeable streams and large rivers. Details on how these standards were derived can be found mainly in Addendum 1 of Suplee et al. (2008). Standards for wadeable streams are sub-grouped by ecoregion, either by level III (coarse scale) or level IV (fine scale). There is also a list of wadeable streams with reach-specific standards; these waterbodies have characteristics dissimilar from those of the ecoregions in which they reside and have therefore been provided more specifically-applicable standards. **For the wadeable streams, the standards should be applied in this order: reach specific (if applicable) then level IV ecoregion (if applicable) then level III ecoregion.** There is also a list of large river segments for which base numeric nutrient standards have been developed.

**Table 12A-2** shows the base numeric nutrient standards for Montana's lakes and reservoirs. For lakes, these are sub-grouped by ecoregion, either by level III (coarse scale) or level IV (fine scale). Also listed are lakes with specific standards; these waterbodies have characteristics dissimilar from those of the ecoregions in which they reside and have therefore been provided more specifically-applicable standards. Reservoir standards are developed case-by-case and are therefore all individually listed. **For the lakes, the standards should be applied in this order: lake specific (if applicable) then level IV ecoregion (if applicable) then level III ecoregion.**

DRAFT

**Table 12A-1. Base Numeric Nutrient Standards for Different Montana Ecoregions and Stream and River Reaches. Related assessment information is also shown.**

Ecoregion <sup>1</sup> (level III or IV) and number, or Reach Description	Period When Criteria Apply	Numeric Nutrient Standard <sup>2</sup>		
		Total Phosphorus (µg/L)	Total Nitrogen (µg/L)	Related Assessment Information <sup>3</sup>

## 2.1 Required Reporting Values for Base Numeric Nutrient Standards

Table 12A-3 presents the required reporting values for total phosphorus and total nitrogen measurements used to conform with the base numeric nutrient standards in this circular.

**Table 12A-3. Required reporting values<sup>a,b</sup> for total nitrogen and phosphorus measurements.**

Nutrient		Method of Measurement	Required Reporting Value
Total phosphorus		Persulfate digestion	3 µg/L
Total nitrogen		Persulfate digestion	70 µg/L
Total nitrogen	Sum of:	(a) total kjeldahl nitrogen	150 µg/L
		(b) nitrate + nitrite	See RRVs below
Nitrate- as N			20 µg/L
Nitrite- as N			10 µg/L
Nitrate + Nitrite-as N			20 µg/L

<sup>a</sup> See definition for required reporting values found in footnote 19 of Department Circular DEQ-7.<sup>b</sup> Concentrations in Table 12A-3 must be achieved unless otherwise specified in a permit, approval, or authorization issued by the Department (DEQ-7; ARM 17.30.702).

## 2.2 Developing Permit Limits for Base Numeric Nutrient Standards

For total nitrogen and total phosphorus, the critical low-flow for the design of disposal systems shall be based on the seasonal 14Q10 of the receiving water (see ARM 17.30.635[4]). When developing permit limits for base numeric nutrient standards, the Department will use an average monthly limit (AML) only, using methods appropriate for criterion continuous concentrations (i.e., chronic concentrations). Permit limits will be established using a value corresponding to the 95<sup>th</sup> percentile probability distribution of the effluent. The Department shall use methods that are appropriate for criterion continuous concentrations which are found in the document “*Technical Support Document for Water Quality-based Toxics Control*”, Document No. EPA/505/2-90-001, United States Environmental Protection Agency, 1991.

## 3.0 Endnotes

(1) Ecoregions are based on the 2009 version (version 2) of the U.S. Environmental Protection Agency maps. These can be found at: [http://www.epa.gov/wed/pages/ecoregions/mt\\_eco.htm](http://www.epa.gov/wed/pages/ecoregions/mt_eco.htm) . For Geographic Information System (GIS) use within DEQ, the GIS layers may be found at: L:\DEQ\Layers\Ecoregions.lyr

(2) No wadeable stream or large river referenced in **Table12A-1** shall have an average concentration that exceeds the values shown based upon a monthly (30-day) period.

(3) Algae density values refer to bottom-attached (benthic ) algal chlorophyll *a* (Chl*a*) or ash free dry mass (AFDM) per square meter of stream bottom. These values are the arithmetic mean of >10 replicates of benthic algae collected in the wadeable zone (water depths ≤ 1m) from a site during a sampling event. A site is a stream reach ≥ 100 m length or, for large rivers, may be a transect perpendicular to flow. For wadeable streams and large rivers, algae replicates must be collected in wadeable zones using a randomized approach or other, unbiased systematic approaches. Chl*a* and AFDM are used to assess the biomass of algae accumulated on the stream bottom; algae is stimulated by excess nitrogen and phosphorus levels and has been associated with impacts to recreational uses and impacts to stream dissolved oxygen levels, for example.

In the case of the Clark Fork River, the maximum summer algae value is the single greatest of any of the monthly means of the Chl*a* values at a given site. Therefore, there is only one month each summer representing the maximum. The summer mean is the arithmetic mean of the set of all replicates collected at a site during a given summer.

(4) **Table F-4** below shows the beginning and ending locations for large rivers in Montana.

**Table F-4. Large river segments within the state of Montana.**

<b>River Name</b>	<b>Segment Description</b>
Big Horn River	Yellowtail Dam to mouth
Clark Fork River	Bitterroot River to state-line
Flathead River	Origin to mouth
Kootenai River	Libby Dam to state-line
Madison River	Ennis Lake to mouth
Missouri River	Origin to state-line
South Fork Flathead River	Hungry Horse Dam to mouth
Yellowstone River	State-line to state-line

(5)) No lake or reservoir referenced in **Table12A-2** shall have an average concentration that exceeds the values shown based upon a monthly (30-day) period. The Department will determine on a case-by-case basis whether or not a permitted discharge to a stream or river is likely to be impacting a lake or reservoir. If yes, the permittee would be expected to meet its average monthly limit year round.

(6) Lake algae concentrations are expressed as micrograms chlorophyll *a* per L.

# Circular DEQ-12, PART B

SEPTEMBER 2012 EDITION

## 1.0 Introduction

Elements comprising Circular DEQ-12, **Part B** are found below. These elements are adopted by the Department following the Department's formal rule making process. Montana state law (§75-5-103 [22], MCA and 75-5-313, MCA) allows for variances from the base numeric nutrient standards (found in **Part A** of this circular) based on a determination that base numeric nutrient standards cannot be achieved because of economic impacts or because of the limits of technology.

## 1.1 Definitions

1. **Limits of technology** means wastewater treatment processes for the removal of nitrogen and phosphorus compounds from wastewater that can achieve a concentration of 70 µg TP/L and 4,000 µg TN/L.
2. **Long-term average** means a description of effluent data from a treatment system using standard descriptive statistics and an assumption that the data follow a lognormal distribution. See also, "*Technical Support Document for Water Quality-based Toxics Control*", Document No. EPA/505/2-90-001, United States Environmental Protection Agency, 1991.

## 2.0 General Nutrient Standards Variances

Because the treatment of wastewater to base numeric nutrient standards in 2011 would have resulted in substantial and widespread economic impacts on a statewide basis (§75-5 -313 [5][a], MCA), a permittee who meets the end-of-pipe treatment requirements provided below in **Table 12B-1** may apply for and may be granted a general nutrient standards variance ("general variance") (§75-5 -313 [5][b], MCA). A person may apply for a general variance for either total phosphorus or total nitrogen, or both. The general variance may be established for a period not to exceed 20 years. A compliance schedule to meet the treatment requirements shown in the table may be granted on a case-by-case basis.

Cases will arise in which a permittee is or will be discharging effluent with N and/or P concentrations lower than (i.e., better than) the minimum requirements of a general variance. And yet, the resulting concentrations outside of the mixing zone still exceed the base numeric nutrient standards. Such discharges are still within the scope of the general variance, because statute indicates that a general variance is allowable if the permittee treats the discharge to, **at a minimum**, the concentrations indicated by §75-5-313(5)(b)(i) and (ii), MCA. Thus, permitted discharges better than those at §75-5-313(5)(b)(i) and (ii), MCA are not precluded from falling under a general variance.

**Table 12B-1. General variance end-of-pipe treatment requirements per §MCA 75-5 -313(5)(b), through May 2016.**

Discharger Category <sup>1</sup>	Long-term Average	
	Total P (µg/L)	Total N (µg/L)
≥ 1.0 million gallons per day	1,000	10,000
< 1.0 million gallons per day	2,000	15,000
Lagoons not designed to actively remove nutrients	Maintain current performance	Maintain current performance

<sup>1</sup> See endnote 1

The Department must review the general variance treatment requirements every 3 years to assure that the justification for their adoption remains valid. The purpose of such review is to determine whether there is new information that supports modifying or deleting the variance. If a low-cost technological innovation for lowering nitrogen and phosphorus concentrations in effluent were to be developed in the near future, for example, the Department could (after May 2016) make more stringent the concentrations shown in the table. If the Department were to adopt general variance treatment requirements more stringent than those provided in **Table 12B-1**, revised effluent limits will be included with the permit during the next permit cycle. A compliance schedule may also be granted to provide time to achieve compliance with revised effluent limits.

Only after changes in specified factors had occurred would the general variance treatment requirements be made more stringent. The review will occur triennially and would generally be carried out at a fairly coarse level (i.e., statewide). The Department and the Nutrient Work Group may consider whether or not:

1. Wastewater treatment technologies and costs for nutrient removal have improved
2. A substantial number of TMDLs had been developed and implemented
3. Nonpoint source BMPs had been widely applied
4. Montana's economic status had changed sufficiently to make treatment more affordable
5. Base numeric nutrient standards should be revised to reflect N- or P-compound speciation and bioavailability
6. Nutrient trading options had been implemented where feasible

## 2.1 Wastewater Facility Optimization Study

Permittees receiving a general variance are required to evaluate current facility operations to optimize nutrient reduction with existing infrastructure and shall analyze cost-effective methods of reducing nutrient loading, including but not limited to nutrient trading without substantial investment in new infrastructure (§75-5-313[9][a], MCA). The Department may request the results of the optimization/nutrient reduction analysis within two years of granting a general variance to a permittee.

Changes to facility operations resulting from the analysis carried out per the above paragraph are only intended to be refinements to the system already in place. Therefore, optimizations should:

1. Address only changes to facility operation and maintenance and not structural changes
2. Not result in rate increases
3. Must include exploration of the feasibility of nutrient trading within the basin

Who and how the analysis is carried out is to be decided by the permittee. The Department encourages the use of a third-party firm with expertise in this subject.

## 3.0 Individual Nutrient Standards Variances

Montana law allows for the granting of nutrient standards variances based on the particular economic and financial conditions of a permittee (§75-5-313 [1], MCA). Individual nutrient standards variances ( "individual variances") may be granted on a case-by-case basis because the attainment of the base numeric nutrient standards is precluded due to economic impacts, limits of technology, or both. In general, individual variances are intended for permittees who would have financial difficulties meeting even the general variance concentrations, and are seeking individual N and P permit limits tailored to their specific economic situation.

Unlike the general variances presented in **Section 2.0** above, individual variances may only be granted to a permittee after the permittee has made a demonstration to the Department of economic impacts, the limits of technology, or both. The Department, in conjunction with the Nutrient Work Group, has developed an assessment process that must be completed. The assessment process is found in the Department guidance document *"Carrying out a Substantial and Widespread Economic Analysis for Individual Nutrient Standards Variances"*.

A permittee, using the assessment process referred to above, must also demonstrate to the Department that there are no reasonable alternatives (including but not limited to trading, compliance schedules, reuse, recharge, and land application) that would allow compliance with the base numeric nutrient standards. If no reasonable alternatives exist, then an individual variance is justifiable and becomes effective and may be incorporated into a permit following the Department's formal rule making process.

Individual variances the Department may adopt in the future will be documented in **Table 12B-2** below.

DRAFT

**Table 12B-2. Table for individual variances that may be adopted.**

MPDES Number	Facility Name	Discharge Latitude	Discharge Longitude	Receiving Waterbody	Receiving Waterbody Classification	Long-term Average		Start Date	Sunset Date (maximum)	Review Schedule (year)	Review Outcome
						Total P (µg/L)	Total N (µg/L)
